

Larix kaempferi

Výška	25 - 30 m, fast growing
Šírka	15-20m
Koruna	broad conical, light, open crown, capricious growing
Kôra a vetvy	red to grey, thick, scaled bark, flakes off
Listy	needles in bundles of up to 50, bluish to dark green, 2 - 3.5 cm
Jesenné sfarbenie	Žltá
Kvety	unremarkable, ovoid ? 1 -1.5 cm reddish brown, ? 0.5 - 1 cm yellowish, April
Plody	oval to round cones, 2 - 3 cm, yellowish brown
Tríne	Žiadny
Jedovatosť	Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá
Typ pôdy	all, apart from acidic soil
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	5a (-28,8 do -26,1 °C)
Odolnosť voči vetru	good, also tolerates sea wind
Ostatná odolnosť	Odolné mrazu (WH 1-6), Odolné vetru
Použitie	pobrežné zóny, priemyselné oblasti
Tvar	Vysokokmeň, Vetvený, Viackmeň, Vyvetvený ihličnan, Vzorový ihličnan
Pôvod	Japan
Synonymum	Larix leptolepis

Deciduous conifer with a pointed, broadly conical and very open crown and horizontal branching pattern. The lower branches often hang down slightly. Width approx. 10 - 15 m. Young specimens grow very quickly; the growth rate slows somewhat later. The bark is red to greyish brown, thick and scaled and flaking off in narrow strips. The twigs are usually reddish brown and slightly hairy, sometimes frosted. The buds are on short shoots and the soft needles grow in bundles of 40 to 50 together. They are bluish green to dark green on both sides and colour to golden yellow late in the autumn. In spite of its Japanese origins, this species is grown more in Europe than the European larch. The tree is also used for landscaping and is excellently suited for use as a hedge plant.
