A spherical-shaped shrub, often grafted on a stem. This generates a compact growing, small tree with a height to circa 4 m. The understock is usually *G. triacanthos* f. *inermis*, which has a grey colour and has fine, shallow fissures. 'Globosa' is a spineless variety. The compound leaf is sometimes pinnate and sometimes twice-pinnate, unfolds late and turns golden yellow in autumn. It is 15 to 20 cm in size. The single leaflets are circa 2 cm. This cultivar does not flower and as a consequence does not bear pods. Tolerant to hard surfaces. Winter hardiness zone: 5a
