

Quercus cerris 'Summer Veil'

Výška	8-10 m
Šírka	3-4m
Koruna	broad conical, later round
Kôra a vetvy	twigs grey-brown to grey-green, felt-like, bark almost black, roughly grooved
Listy	elongated to oval, lobes are very deeply dissected, green, 6 – 12 cm
Plody	long ovoid, 2.5 - 3 cm, in groups of 1 - 4, cupule with long, narrow reflexed scales
Tŕne	Žiadny
Jedovatosť	Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá
Typ pôdy	preferably limy
Pôdna vlhkosť	Vhodné do vlhkých pôd
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	6a (-23,3 do -20,6 °C)
Ostatná odolnosť	Odolné mrazu (WH 1–6), Odolné vetru, Odolné posypovej soli
Použitie	pobrežné zóny, priemyselné oblasti
Tvar	Vysokokmeň
Pôvod	Boomkwekerij M.M. Bömer, Zundert, The Netherlands, 1995

Medium-sized tree with a somewhat irregular broadly conical to round crown. Grows significantly slower than the species and eventually stays smaller. The trunk has less thickness growth and the twigs are relatively thin. The most striking feature of 'Summer Veil' is its very deeply lobed leaves. The leaves are lobed to the main vein in many places. In turn, the pointed lobes are also coarsely toothed. The foliage is green in summer, turning yellow-brown in autumn and remaining on the tree until deep into winter, when it dries out. Prone to bark cracking in frost. The deeply lobed leaves give the tree an attractive, fine texture. This cultivar originated as a seedling of *Q. cerris* and was marketed by Van den Berk Nurseries, Sint-Oedenrode, the Netherlands.
