

Larix decidua 'Puli'

Šírka	2-3m
Jesenné sfarbenie	Žltá
Tŕne	Žiadny
Jedovatosť	Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	3 (-40,0 do -24,5 °C)
Ostatná odolnosť	Odolné mrazu (WH 1–6), Odolné vetru
Použitie	malé záhrady, dvory
Tvar	Vysokokmeň, Vyvetvený ihličnan, Vzorový ihličnan

Larix decidua 'Puli' forms a small tree with strongly drooping branches and twigs. This cultivar does not form a continuous central branch and its height therefore depends on the graft height. Most striking about 'Puli' is its very characteristic appearance. Unlike some forms of 'Pendula', the branches of 'Puli' are slightly curved. The branches are relatively thin. These features create a distinctly more informal and graceful habit. On the longer twigs the needles are scattered, on short shoots they are in bundles, typical of Larix. The needles are greyish green and turn yellow in autumn before falling off. 'Pendula' does best in slightly alkaline soils. Does not tolerate paving and is especially suitable as a solitary in (small) gardens, parks, cemeteries, etc. Good wind resistance and very hardy. Was found by Miklòs Jòzsa in Hungary around 1972. Around 1990, 'Puli' was spread in the rest of Europe. In Hungary it was by then already a fairly widely cultivated plant. Hardiness zone: 3
