

## Picea pungens 'Glaucia Globosa'

|                            |  |
|----------------------------|--|
| Výška                      | 4 m  |
| Šírka                      | 1-2m   |
| Koruna                     | flatened spherical, dark, dense crown                                      |
| Kôra a vetvy               | brown, grey  |
| Listy                      | greygreen, bluegreen, evergreen  |
| Kvety                      | unremarkable, flowers in May   |
| Plody                      | green, yellowbrown   |
| Trne                       | Žiadny   |
| Jedovatosť                 | Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá                        |
| Typ pôdy                   | clay soil, loamy soil, sandy soil, acid soil, calcareous soil              |
| Pôdna vlhkosť              | Vhodné do suchých pôd  |
| Spevnené plochy            | Netoleruje spevnené plochy   |
| Zóna odolnosti             | 4 (-34,4 do -28,9 °C)  |
| Ostatná odolnosť           | Odolné mrazu (WH 1–6)  |
| Stromy pre zvieratá a hmyz | Odolné mrazu (WH 1–6), Plody ako potrava pre vtáctvo                       |
| Použitie                   | stromy do nádob, strešné záhrady, priemyselné oblasti, malé záhrady, dvory |
| Tvar                       | Vysokokmeň, Vzorový ihličnan   |

Picea pungens 'Glaucia Globosa' is a shrub form with an irregular, bulbous to flattened spherical growth habit. Does not usually grow much higher than about 2 m. Twigs yellowish brown, older branches and bark greyish brown to blackish grey. The stiff sharply pointed needles are blue-grey. Needle colour is less intense than in cultivars such as 'Erich Frahm' and 'Hoopsii'. The needles are close together giving the plant a very dense and compact appearance. Suitable for use in gardens, parks, planters, cemeteries, etc. 'Glaucia Globosa' was grown in 1937 by Anth. Kluys in Boskoop as a seedling. Only from 1955 was the plant distributed. Hardiness zone: 4
