

Thuja plicata 'Atrovirens'

Výška	15 - 25 m, fast growing
Šírka	5-8m
Koruna	narrow pyramidal, later narrow conical, dark, dense crown
Kôra a vetvy	twigs green to reddish brown, bark reddish brown, flaky and fibrous
Listy	scales, glossy, very dark green, evergreen
Kvety	inconspicuous, fragrant flowers
Plody	narrow oval cones, light brown, scaly, approx. 1 cm
Trne	Žiadny
Jedovatosť	Má jedovaté časti
Typ pôdy	any
Pôdna vlhkosť	Odolné voči krátkodobému zaplaveniu
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	6a (-23,3 do -20,6 °C)
Odolnosť voči vetru	good
Ostatná odolnosť	Odolné mrazu (WH 1–6), Odolné vetru
Použitie	priemyselné oblasti
Tvar	Vyvetvený ihličnan, Vzorový ihličnan, Ihličnan na živý plot
Pôvod	before 1897

Narrow, upright growing and densely branched tree which remains more slender than the species. The crown is initially narrow pyramidal and later narrow conical. Normally the tree grows to around 20 m tall with a width of about 4 m, but after many years it can become much taller. The bark is reddish brown, fibrous and flaky. The young twigs are green first, later turning reddish brown. Like the species, the lower branches can take root when they touch the ground and, seemingly form new trees. The scaly foliage is arranged in shingle form and glossy very dark green, in winter too. When crushed the foliage gives off a characteristically pleasant fragrance. The blossom and the oval cones which follow are inconspicuous. 'Altovirens' can tolerate pruning and is therefore a good hedge plant. The glossy, dark green foliage can form an excellent background for colourful borders.
