

Thujopsis dolabrata

Výška	15-20 (40) m
Šírka	3-6m
Koruna	narrow conical, half-open crown, capricious growing
Kôra a vetvy	reddisch brown
Listy	green, evergreen
Kvety	unremarkable
Trne	Žiadny
Jedovatosť	Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá
Typ pôdy	clay soil, loamy soil, sandy soil, peaty soil, acid soil
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	6 (-23,3 do -17,8 °C)
Odolnosť voči vetru	good
Ostatná odolnosť	Odolné mrazu (WH 1-6), Odolné vetru
Použitie	priemyselné oblasti
Tvar	Vyvetvený ihličnan, Vzorový ihličnan

Thujopsis dolabrata is a distinctive sturdy shrub, growing into a large tree. In young age the crown is broad pyramidal, in older trees it is pyramidal. Forms a straight trunk with reddish-brown branches. The old bark flakes off papery with large grey flakes. The foliage is scaly, with the scales being significantly larger than in Chamaecyparis or Thuja. These are bright green with a broad, white lenticel stripe on the underside. Unlike its (almost) namesake Thuja, the foliage does not smell as distinctive when bruised. T. dolabrata is an important forest tree in Japan, where it was one of the trees originally allowed to be cut and used only by the imperial family. The wood is light, soft and contains no resin. It is easy to work with and suitable for many purposes. The Hibacypress can be used as a solitary or in groups in gardens and parks and in cemeteries. Can grow in both sun and shade and likes nutrient-rich, humus-rich soil that is sufficiently moist but still well-drained.
