'Leskovacka' is a small tree with a broad-oval to almost round crown with a height of 3-5 m. Sometimes the tree grows taller, up to about 8 m. It is a moderately strong grower and the branches grow up quite steeply. The young twigs are felt-like hairy and the old bark is black-brown. The ovoid to oval leaves are dark green and 5-8 cm in size. Flowering is around mid- to late May, markedly later than most other *C. oblonga*. The flowers are white to soft pink and 4-5 cm in size. The edible fruits ripen around mid-October. These are apple-shaped, greenish-yellow to yellow and about 10 cm in size. The productivity of 'Leskovacka' as a young tree is already regular and good. Was found as a chance seedling in Serbia around 1880. Besides its good fruiting, the tree stands out because it is slightly more hardy than other cultivars and is little susceptible to mildew. Hardiness zone 5a
