

Quercus robur 'Irtha'

Výška	6 - 10 m
Šírka	6-8m
Koruna	round, half-open crown
Kôra a vetvy	twigs reddish brown, bark dark grey, deeply grooved
Listy	obovate, pinnately cleft to pinnately parted, lobes narrow and very deeply dissected, dark green, 5 - 14 cm
Kvety	green-yellow ? catkins, 2 - 4 cm, May
Plody	ovate to oval, 1.5 - 2.5 cm, in groups of 2 - 6, cupule with triangular contiguous scales
Tríne	Žiadny
Jedovatosť	Zvyčajne nie je jedovaté pre ľudí a väčšie zvieratá
Typ pôdy	fertile and moist
Pôdna vlhkosť	Vhodné do vlhkých pôd
Spevnené plochy	Netoleruje spevnené plochy
Zóna odolnosti	5a (-28,8 do -26,1 °C)
Odolnosť voči vetru	good
Ostatná odolnosť	Odolné mrazu (WH 1–6), Odolné vetru, Odolné posypovej soli
Použitie	bulváre a široké ulice, priemyselné oblasti
Tvar	Vysokokmeň, Viackmeň
Pôvod	Bömer Tree Nursery, Zundert, the Netherlands, circa 1985

This tree originated as a seedling, probably from Q. robur 'Cristata' or 'Strypemonde'. Grows more slowly than the species and remains smaller. It grows to a medium-size tree, 6 to 10 m tall with a somewhat irregular round crown. The bark and twigs are like those of the species, but the leaf is totally different. It is very deeply pinnately cleft to pinnately parted with narrow lobes that are also slightly dissected. The lobes are also slightly twisted. The striking leaf gives 'Irtha' a graceful appearance. Its modest size, for a Q. robur, makes it not only suitable as a park tree, but also for use in wide avenues.
